THE 8TH IET SCS-2024 SYMPOSIUM SETUP AND PURPOSE

IET Technical Support: The Institution of Engineering and Technology

17 Years ... Way Forward and a Sense of a Purpose:

The first IET forum at the University of Bahrain has started since 2008. The first IET Smart Systems International Conference was also during 2008. Since the year 2008, we have been organizing the local IET forums, and then indexed Symposiums in an annual basis at University of Bahrain.

As annually planned, also this year of 2024, the University of Bahrain; 8th Smart Cities Symposium (1-3 December 2024) is also organized with collaboration of the IET, (The Institution of Engineering and Technology), UK.

Smart Cities is a new and emerging concept that have received a substantial attention for a while. This is because of the fast development of Engineering Concepts, IT and ICT sectors. Smart cities are a used term used to define employment of smart technologies and data as the means to solve cities' sustainability challenges and prosper. In this sense, many cities are in the process of transforming themselves to be smart. This can be achieved while relying on and using data and technology to improve several sectors. Sectors that are applicable for such transformations are:

{Transport, Energy use, Health issues, Health care, and Air quality, or to Drive economic growth}. Others are being built to be smart from the start. This is a term that relates to the present and to the future. Nevertheless, in general notion, cities world-wide consume substantial resources and global energy supply, which make them much under demand to be transformed to smart. Reports are also showing that, there are growing numbers of the world's natural resources, global energy supply, healthcare issues, the need of fast and easy transports, and easy health care. In addition, over the coming twenty years, it is expected that cities worldwide will generate not less than 60 per cent of global GDP. In this sense there are potentials that, Engineering and High Technologies will help and participate to resolve several issues and demands of current cities.

The regional infrastructure, and the ICT backbone, are developing very fast, that makes the concept of smart cities are very applicable concepts locally. Therefore, the event will be an excellent platform and a site for energetic and dynamic discussions between locally demanding parties, possible international experts, and the community of academics, decision makers, researchers, practitioners, real estate developers in Bahrain, investors, and policy makers from the urban spheres. This is all with the aim to explore such emerging trends and innovative solutions to green and smart cities within the region.

The main purpose of the event is to create awareness about the prospects of Smart Cities. The event will serve as a platform to exchange ideas and throughout in an international prospect. The event objectives are also in emphasizing the role of academic institutions in promoting a smarter kingdom via its consultancy, building smarter ideas or continuity in the form of publications, and creating innovative solutions. In addition, such organization of the event, will also focus on networking opportunities, and that the event is a good starting point and could help in making networking opportunities for smart cities.

The event venue (the symposium) will be at University of Bahrain, and will run for three days, 1-3 December 2024. The symposium will involve both invited speakers (talking about load needs for smart cities), in addition to academic submitted papers (with review), as they will be published afterward within the IET (once satisfying the needed technical standards of the IET).

The event is also to create awareness about the prospects of Smart Cities. The symposium is a platform to exchange ideas and thoughts in international prospects. The symposium is a platform for emphasizing the role of academia in promoting Smart Cities, Digital Twins of Cities, Projects, Smarter Ideas, and Consultancies. The symposium is a platform for research community in forms of publications and creating innovative solutions.

TALK ABSTRACT

In the pursuit of sustainable smart cities, the integration of low-cost, scalable, and energy-efficient technologies is paramount. This presentation explores the crucial role of printable electronics in advancing smart city infrastructure. Our research focuses on the development of printable semiconductors (e.g., organic semiconductors, lead-free perovskite derivatives, and carbon nanotubes) for low-cost ultra-low-power electronics, indoor photovoltaics, and sensors. These technologies offer significant potential for smart city applications involving distributed sensor networks, energy harvesting systems, and responsive urban environments. Specifically, we demonstrate how printable indoor photovoltaics, based on lead-free perovskite derivatives, could power IoT devices in indoor environments, reducing reliance on batteries and minimizing electronic waste. Furthermore, our printable light sensors, based on organic and perovskite-based semiconductors, could enable real-time monitoring, crucial for adaptive lighting and energy management systems in smart cities. The flexibility, cost-effectiveness, and low environmental impact of these printable technologies position them as potential key enablers of next-generation smart city applications. This talk will detail the technological innovations and application potential of our research, providing insights into how printable sensors and energy harvesters could contribute to the sustainable evolution of smart cities, from energy-efficient buildings to intelligent transportation systems.

TALK ARSTRACT

Smart cities are cities that embrace technology and incorporate it, benefiting from it and improving the safety and quality of life of their citizens. Over the past years, IoT solutions have proven the added value they bring in many aspects of everyday life in the modern cities. Prisma Electronics, via its integrated and ever-expanding PrismaSense smart solutions ecosystem, attempts to integrate IoT and sensor networks-related novelties in the modern citizens' everyday lives, thus improving them. Two recent applications of PrismaSense are going to be presented: The first focuses on safety and energy efficiency improvement and provides critical infrastructure structural health condition and energy efficiency monitoring for the maritime industry with direct application to more critical infrastructures of any city. The second focuses on facilitating and operating independent, parallel satellite communication channels for the maritime industry, provided by Prisma Electronics' first nanosatellite mission. The ultimate goal is to effectively and uninterruptedly collect, analyze and fuse data to achieve data-driven decisions and condition-based maintenance for critical assets, guaranteeing citizen safety in the

TALK ABSTRACT

Talk Abstract: The ever-expanding landscape of smart cities presents a challenge: efficiently navigating the vast amount of data and resources available to citizens. Traditional search applications often struggle to keep pace with the dynamic nature of these environments. This talk explores how Large Language Models (LLMs) can revolutionize smart city search, offering a more intuitive and comprehensive user experience. We begin by outlining the limitations of current search functionalities in smart cities. Siloed data and keyword-based search make it difficult for citizens to find the information they need, hindering engagement and overall user satisfaction. Next, we introduce the transformative potential of LLMs. By ingesting and understanding vast amounts of unstructured data, LLMs can provide a more nuanced and context-aware search experience. Imagine a resident asking, "What's the fastest way to get to the public library considering current traffic conditions and nearby bike-sharing availability?" An LLM-powered search engine could not only understand the natural language query but also synthesize data from transportation departments, bike-sharing services, and real-time traffic feeds to deliver an optimal answer. The talk will delve into the specific applications of LLMs in smart city search. We'll explore how LLMs can personalize search results based on user preferences and past interactions, fostering a more user-centric experience. We'll also discuss the potential for LLMs to anticipate user needs and proactively surface relevant information, promoting proactive citizenry and engagement with city services. In conclusion, this talk presents a compelling vision for the future of smart city search, powered by the transformative capabilities of Large Language Models. By harnessing the power of LLMs, we can empower citizens to navigate their smart cities with greater ease and efficiency, ultimately fostering a more connected and thriving urban environment.

TALK ABSTRACT

Abstract: It is very important to ensure the security of visual data which has become an integral part of smart cities. Images and videos collected through various sensors and cameras are critical for the smooth functioning of smart cities, such as security monitoring, traffic management, etc. However, this visual data may be vulnerable to unauthorized access, misuse and alteration. The science of image cryptography offers effective solutions to ensure the privacy and integrity of images and videos. This keynote speech explores the importance of image cryptography for security against unauthorized exploitation, and assurance of data integrity. In addition, the lecture will present advanced image cryptography techniques that meet the specific needs of smart cities.
